

IN THE SPECIFICATION:

Page 10, paragraph starting at line 31, is amended as follows:

The terminal MS then checks 402 the network names of the available access points based on the collected information. According to an embodiment, the MS compares the network names of available access points advantageously to the network name settings of the stored information sets and drops access points with network names not described in any of the network name settings 403. The MS compares the connection attributes of access points with the same network name as the currently serving access point, compares the connection attributes of access points with the ~~same~~ different network name as than the currently serving access point and selects access points with the best connection attributes. Connection attributes may be any kind of attributes comprising information concerning the possible connections to access points. MS selects 404 a first access point having the best connection attributes of the available access points with the same network name as the currently serving access point. The MS also selects 405 a second access point having the best connection attributes of the available access points with a different network name than the currently serving access point.
